1. General Description

NV3041A is a single-chip SOC driver for 262,144-color, a-TFT liquid crystal display with maximum resolution of 480RGBx272 dots. It contains 720-channel source driver, a 544-channel Gate driver which used for dual-gate control, 293760 bytes GRAM for graphic display data, internal precise power supply circuit which supports full color, 6-color display mode and sleep mode.

NV3041A provides parallel 8/9/16-bit data bus MCU interface with 8080-I/8080-II, 3/4 Wire serial peripheral interface (SPI), 2 data line SPI interface, Q-SPI interface and 6/18bit data bus RGB interface. The display area can be specified in internal GRAM by window address function.

NV3041A is suitable for medium or Industrial products which low power characteristics is major concern. And it can make a display system with fewest components.

2. Features

- Display resolution options:
 - > 480(RGB) (H) X 272 (V)
 - > 320(RGB) (H) X 240 (V)
- LCD Driver Output Circuits
 - > Source Outputs: 720 Channels
 - > Gate Outputs: 544 Channels
 - Common Electrode Output
- 64 gray scale with true 6 bit DAC
- ◆ Interface
 - > 8-bits/16-bits interface with 8080-I/8080-II series MCU
 - > 6/18-bit RGB interface
 - > 3-wire/4-wire Serial Peripheral Interface (SPI)
 - > 2 data lane SPI
 - > Q-SPI
- On Chip Build-In Circuits
 - > DC/DC Converter
 - > Timing Controller
 - > Graphic RAM: 293760 bytes
 - > Non-Volatile (NV) Memory to store initial Register setting and factory default value
- Wide Supply Voltage Range
 - > I/O Voltage (IOVCC to DGND): 1.65V ~ VCI
 - ➤ Analog Voltage (VCI to AGND): 3.0V ~ 3.6V
 - > Charge pump Voltage (VCIP to PGND): $3.0V \sim 3.6V$
- On-Chip Power System
 - \rightarrow GVDD: +5.968V ~ +4.96V
 - \rightarrow GVCL: -4.48V \sim -2.96V
 - > Gate driver HIGH level (VGH to AGND): $+13.36V \sim +16.197V$
 - > Gate driver LOW level (VGL to AGND): -10.83V~ -7.995V
- Optimized layout for COG Assembly

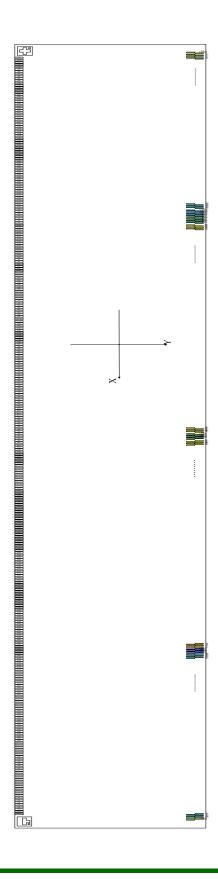

3. Pad arrangement

3.1. Output Bump Dimension

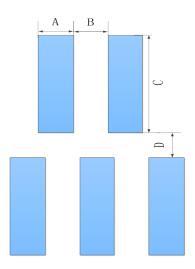

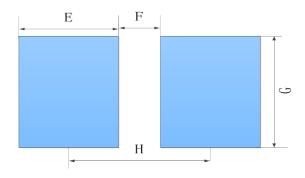

3.2. Bump Dimension

Output Pin: S1~S720 \ G1~G544 \ VCOM \ DUMMY (Pin 332-1628)

| Symbol | Item | Size |
|--------|-------------------------|------------------|
| A | Bump Width | 15um |
| В | Bump Gap 1 (Horizontal) | 15um, 30um, 75um |
| С | Bump Height | 100um |
| D | Bump Gap 2 (Vertical) | 30um |

Input Pin: Pin 1-331

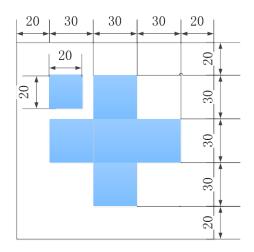

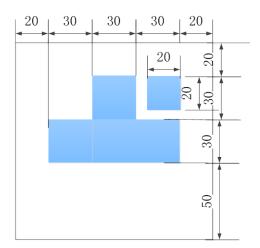

| Symbol | Item | Size |
|--------|-------------|-------|
| Е | Bump Width | 35um |
| F | Bump Gap | 24um |
| G | Bump Height | 100um |
| Н | Bump Pitch | 59um |

3.3. Alignment Mark Dimension

Alignment Mark: A1(X,Y)=(-9963,-235) Alignment Mark: A2(X,Y)=(+9963,+235)

3.4. Pad Coordinates

5. Pin Description

| Pin Name | I/O | Description |
|-----------|-----|--|
| CS | I | Chip select, internal pull high. |
| SDA | I | Serial communication data input and output, internal pull low. |
| WRX | I | Clock input, internal pull high. |
| RDX | I | MCU interface read enable input, internal pull high. |
| DCX | I | Data or Command flag DCX = "H" is data DCX = "L" is command Internal pull high. |
| SPI4W | I | Std SPI 3/4 wire selection. SPI4W="H", 4 wire SPI; SPI4W="L", 3wire SPI. |
| PARA_SERI | I | PARA_SERI="H", Parallel 18-bit RGB input through DR2~7, DB2~DB7, DG2~DG7. PARA_SERI="L", Serial 6-bit RGB input through DG2~DG7. Internal pull high. |
| DR2~DR7 | I | 6-bit digital Red data input, internal pull low. |
| DG2~DG7 | I | 6-bit digital Green data input, internal pull low. |
| DB2~DB7 | I | 6-bit digital Blue data input, internal pull low. |
| DCLK | I | Clock signal; latching data at the falling edge, internal pull low. |
| HSYNC | I | Horizontal sync signal; negative polarity, internal pull high. |
| VSYNC | I | Vertical sync signal; negative polarity, internal pull high. |
| DE | I | Data input enable. Active High to enable the data input, internal pull low. |
| SYNC | I | No Function. User should connect it to "Low", internal pull low. |
| HDIR | I | Horizontal scan direction control (Please refer to the register setting : HDIR) HDIR (pin) = "Low": The definition of HDIR register setting is inversion from original. HDIR (register) = "0": Shift from left to right; HDIR (register) = "1": Shift from right to left. (Default) HDIR (pin) = "High": The definition of HDIR register setting is invariant. |

| Pin Name | I/O | Description | |
|----------|-----|--|--|
| | | HDIR (register) = "0": Shift from right to left; HDIR (register) = "1": Shift from left to right. (Default) Internal pull high. | |

VDIR (register) = "0": Shift from up to down; VDIR (register) = "1": Shift from down to up. (Default) VDIR (pin) = "High": The definition of VDIR register setting is invariant. VDIR (register) = "0": Shift from down to up; VDIR (register) = "1": Shift from up to down. (Default) Internal pull high. | |
| VDPOL | Ι | VSYNC polarity control. VDPOL="1", negative polarity VDPOL=0, positive polarity When not used, user should connect it to "High" (Please refer to the register setting: VDPOL) Internal pull high. | |
| HDPOL | Ι | HSYNC polarity control. HDPOL="1", negative polarity HDPOL="0", positive polarity When not used, user should connect it to "High" (Please refer to the register setting: HDPOL) Internal pull high. | |
| DCLKPOL | Ι | DCLK polarity control. DCLKPOL="1", negative polarity DCLKPOL="0", positive polarity (Please refer to the register setting : DCLKPOL) Internal pull high. | |
| SBGR | I | Data R[7:2] & B[7:2] exchanged internally SBGR="1" R[7:2]→B[7:2] B[7:2]→R[7:2] SBGR="0" R[7:2]→R[7:2] B[7:2]→B[7:2] Internal pull low. | |
| GRB | I | Global reset. Active low, Internal pull high | |
| DISP | I | User should connect it to "Low", Internal pull high. | |
| IM[2:0] | I | IM = 3'b000, Intel-8080 interface enable; IM = 3'b001, Standard SPI interface enable; IM = 3'b010, Dual SPI interface enable; | |

| Pin Name | I/O | Description | |
|---------------------|-----|--|--|
| | | IM = 3'b011, Quard SPI interface enable; IM = 3'b100, RGB interface enable. Internal pull low. | |
| TE | О | Tearing effect output pin is used to synchronize MCU frame writing, activated by S/W command. When this pin is not activated (TE function OFF), this pin is GND level. | |
| Power Supply | | | |
| VCI | P | Power supply for analog circuit | |
| IOVCC | P | Power supply for digital interface I/O pins | |
| VCIP | P | Power supply for charge pump circuit | |
| AGND | G | Ground pin for analog circuit | |
| DGND | G | Ground pin for digital circuit | |
| PGND | G | Ground pin for charge pump circuit | |
| DVDD | P | Internal digital power | |
| VPP | P | Power input pin for NVM. When writing NVM, it needs external power supply voltage (7.5V). If not used, let this pin open. | |
| AVCL | P | Power pad for analog circuit. | |
| AVDD | P | Power pad for analog circuit. | |
| VGH | P | Positive power supply for gate driver output. | |
| VGL | P | Negative power supply for gate driver output. | |
| GVDD | P | A reference voltage (Positive) of grayscale voltage generator. | |
| GVCL | P | A reference voltage (Negative) of grayscale voltage generator. | |
| VGSP | P | Internal Virtual Ground monitor pin | |
| Test Pin | · | | |
| TEST_IN3 | I | Test pins for internal testing only. Internal pull low. | |
| TEST_IN4 | I | Dummy pin | |
| TEST_IN5 | I | Test pins for internal testing only. Internal pull high. | |
| TESTIN0~3 | I | Dummy pins | |

| Pin Name | I/O | Description | |
|--------------|-----|--|--|
| TESTOUT9 | | | |
| TESTOUT11 | | | |
| TESTOUT13 | О | Analog test pins for internal testing only. | |
| TESTOUT14 | | | |
| TESTOUT15 | | | |
| TESTOUT[0:7] | О | Digital test pins for internal testing only. | |

Note:

I: input, O: output, I/O: input/output, P: power input, G: GND If unused pin don't floating, the pin fix to IOVCC or DGND.

6. Interface Description

6.1. Interface and Bus Mapping

The interface of NV3041A supports 8/9/16 bit parallel data bus for 8080 series, Std SPI, D-SPI, Q-SPI and RGB interface.

Selection of these interface are set by IM<2:0> pins as shown below Table 6-1-1.

| IM2 | IM1 | IM0 | Interface | Read Back Data Bus Selection |
|-----|-----|-----|---------------------|-------------------------------------|
| | | | 8080 series 8bit | DG3-2, DB7-2 |
| 0 | 0 | 0 | 8080 series 9bit | DG4-2, DB7-2 |
| | | | 8080 series 16bit | DR5-2, DG7-2, DB7-2 |
| 0 | 0 | 1 | 3/4-wire Std SPI | SDA: In/Out |
| 0 | 1 | 0 | Dual SPI | SDA:In/Out |
| 0 | 1 | | | DCX:In |
| | 0 1 | 1 | Quad SPI | SDA:In/Out |
| 0 | | | | DCX:In |
| 0 | | | | DB[2]:In |
| | | | | DB[3]:In |
| | | | Parallel 18-bit RGB | DR7-2, DG7-2, DB7-2 |
| 1 | 1 0 | 0 | Serial 6-bit RGB | DG7-2(Default) |
| | | | | Use register E1H bit[1:0] to select |
| | | | | from DR7-2, DG7-2 or DB7-2 |

Table 6-1-1

6.2. Inter-8080 Parallel Interface

The MCU 8080 interface has different bus width application as 8/9/16bit. The chip-select CSX (active low) enables and disables the parallel interface. GRB (active low) is an external reset signal. WRX is the parallel data write, RDX is the parallel data read and DR[7:2], DG[7:2], DB[7:2] is parallel data.

NV3041A latches the input data at the rising edge of WRX signal. The DCX is the data or command flag. When DCX='1', DR[7:2], DG[7:2], DB[7:2] bits are display RAM data or command parameters. When DC='0', DR[7:2], DG[7:2], DB[7:2] bits are commands.

The 8080-series bi-direction interface can be used for communication between the micro- controller and LCD driver chip. The interface functions of 8080-series parallel interface are given in Table 6-2-1.

| IM2 | IM1 | IM0 | 41H bus_width[1:0] | Interface |
|-----|-----|-----|-----------------------|-----------------|
| 0 | 0 | 0 | 2'b01 | 8-bit parallel |
| 0 | 0 | 0 | 2'b10 | 9-bit parallel |
| 0 | 0 | 0 | 2'b11 | 16-bit parallel |

Table 6-2-1

6.2.1. Write Cycle/Sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control (DCX, RDX, WRX) and data signals (DR[7:2], DG[7:2], DB[7:2]). DCX bit is a control signal, which tells if the data is a command or a data. The data signals are a command if the control signal is low (= '0') and vice versa it is data (= '1'). The write cycle is described in the following figure.

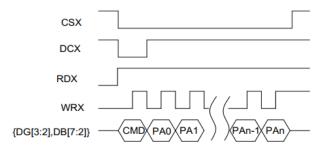

Figure 6-2-1-1 8080 MCU Write sequence (8-bit parallel)

6.2.2. Read Cycle/Sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from the display via interface. The display sends data (DR[7:2], DG[7:2], DB[7:2]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

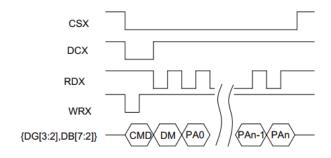

Figure 6-2-2-1 8080 Read sequence (8-bit parallel)

Note:

- 1. Reading operation applied for command code: DAh, DBh, DCh, 04h, 09h, 0Ah, 0Bh, 0Dh, 0Eh, etc.;
- 2. Read operation need one dummy cycle.

6.3. SPI interface (Std-SPI, Dual-SPI, Quard-SPI)

6.3.1. Introduction

| Pad Name | Serial Interface Pin Name | Description |
|-------------|-------------------------------------|--|
| CS | CSX | A chip select signal. Signal is active low. |
| WRX | SCL | This pin is used serial interface clock. |
| SDA | SDA/ SDO1 SPI bi-direction data pin | |
| DCX | DCX/SDO2 | Std-SPI(4 wire): command or parameter select. Dual-SPI: the second data lane. Quard-SPI: the second data pin |
| DB2 | SDO3 the third pin of Quard-SPI | |
| DB3 | SDO4 the fourth pin of Quard-SPI | |

Table 6-3-1-1

The selection of interface is done by IM<2:0> bits. Please refer to below Table 6-3-1-2

| IM2 | IM1 | IM0 | 41H bus_width[1:0] | OPCODE | SPI4W | Interface |
|-----|-----|-----|-----------------------|-------------|-------|---------------------------------|
| 0 | 0 | 1 | | | 0 | 3-wire 9bit SPI |
| | | | | | 1 | 4-wire 8bit SPI |
| | | | 2'b 00 | | | 6bit Dual-SPI |
| 0 | 1 | 0 | 2'b 01 | | | 8bit Dual-SPI |
| | | | 2'b 10 | | | 9bit Dual-SPI |
| 0 | 1 | 1 | | 8'h02 | | 1 line data or cmd Quard-SPI |
| | | | | 8'h32/8'h12 | | 4 line data Quard-SPI |

Table 6-3-1-2

6.3.2. Std SPI Interface

NV3041A supplies 3-wire/ 9-bit and 4-wire/8-bit bi-directional serial interfaces for communication between MCU and NV3041A Driver.

The 3-wire serial mode consists of the chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA or SDA/SDO).

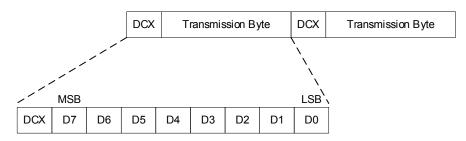

The 4-wire serial mode consists of the Data/Command selection input (DCX), chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA or SDA/SDO) for data transmission. The data bus (DR[7:2], DG[7:2], DB[7:2]), which are not used, must be connected to GND.

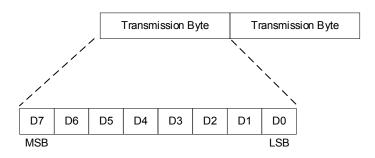

6.3.2.1. Write Cycle Sequence

The write mode of the interface means that MCU writes commands or data to NV3041A. The 3-wire serial data packet contains a data/command select bit (DCX) and a transmission byte. If the DCX bit is "low", the transmission byte is interpreted as a command byte. If the DCX bit is "high", the transmission byte is captured as RAM data or parameter of specified register.

Any instruction can be sent in any order to NV3041A and the MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse and SDA data are no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. See the detailed data format for 3-/4- wire serial interface.

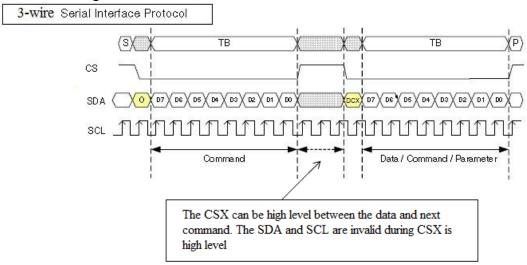

Std-SPI 3-Wire Data flow

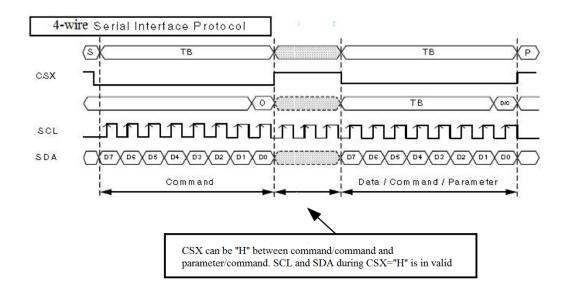

Std-SPI 4-Wire Data flow

MCU drives the CSX pin to low and starts by setting the DCX bit on SDA. The bit is read by NV3041A on the first rising edge of SCL signal. On the next falling edge of SCL, the MSB data bit (D7) is set on SDA by the MCU. On the next falling edge of SCL, the next bit (D6) is set on SDA. The 3/4-wire serial interface writes sequence described in the figure as below.

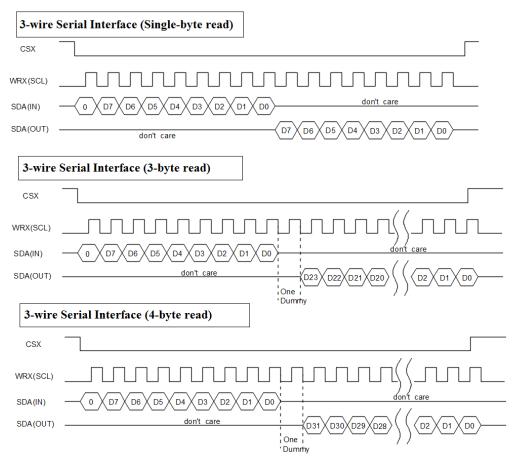

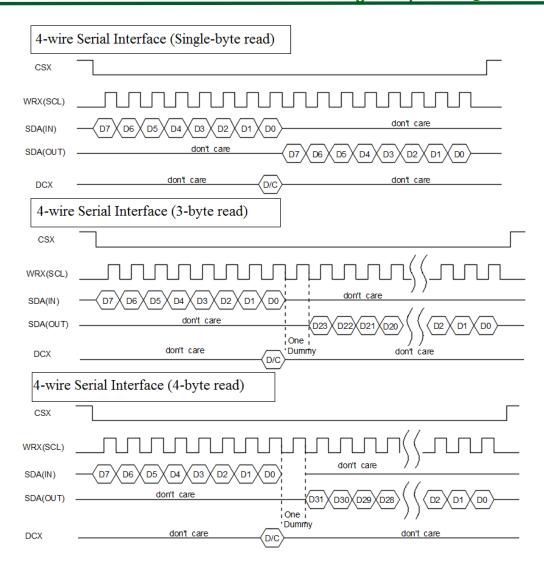

6.3.2.2. Read Cycle Sequence

The read mode of interface means that the MCU reads register's parameter from NV3041A. The MCU has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. NV3041A latches the SDA (input data) at the rising edges of SCL (serial clock), and then shifts SDA (output data) at falling edges of SCL (serial clock). After the read status command has been sent, the SDA line must be set to tri- state and no later than at the falling edge of SCL of the last bit. The read mode has two types of transmitted command data (single/multi-byte) according to command code.

6.3.3. Dual-SPI Interface

NV3041A supplies 6-bit, 8-bit and 9-bit Dual SPI interfaces for communication between MCU and NV3041A.

Two data lane serial interface use: CSX (chip enable), DCX(serial clock) and SDA (serial data input/output 1), and WRX (serial data input 2).

Set IM<2:0> as 3'b010 to enable Dual-SPI interface.

6.3.3.1. Write Cycle Sequence

The command write protocol of 2 data lane serial interface is the same with the 3-wire serial interface. RAM write sequences are illustrated in section 6.4.14 and 6.4.15.

6.3.3.2. Read Cycle Sequence

The read mode of 2 data lane serial interface is the same with the 3-wire serial interface. No RAM Reading supported.

6.3.4. Quad-SPI Interface

NV3041A supports Quad SPI interfaces for communication between MCU and NV3041A.

Four data lane serial interface use: CSX (chip enable), WRX (serial clock) and SDA (serial data input/output 1), DCX (serial data input 2), DB2 (serial data input 3) and DB3 (serial data input 4).

Set IM<2:0> as 3'b011 to enable QSPI Interface.

Each transmission has three part: op-code (first byte after CSX falling edge), Address and Data. op-code used to distinguish different operations between MCU and NV3041A, as below table shows.

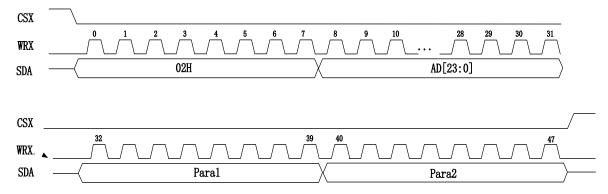

| OP code | Operation | Description |
|---------|------------------|---|
| | | In general, this operation used to write registers. |
| 02H | Write Command | When the address is "2C", the following data is |
| 0211 | | identified as RAM data. It's not a good choice |
| | | because of its slowly accessing rate. |
| 03H | Read Command | Read register content from NV3041A |
| 12H | Write RAM data | The address must be "2C" and the timing takes 24 |
| 12Π | WITTE KAIVI data | cycles, see the section 6.4.12 and 6.4.13 for details |
| 32H | Write RAM data | The address must be "2C" and the timing takes 6 |
| | WITH KAN dala | cycles, see the section 6.4.12 and 6.4.13 for details |

Note: Each transmission must end with CSX rising edge.

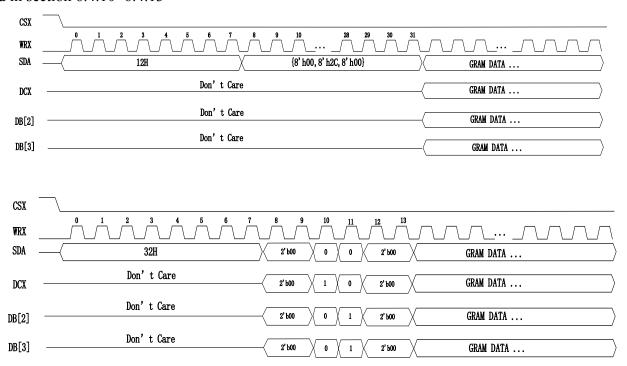

6.3.4.1. Write Cycle Sequence(op code = "02H")

The function of command writing is driven by CSX, WRX, SDA, as shown below. op code "02H" is sent after CSX falling edge. AD[23:0] format is {8'h00,CMD[7:0],8'h00}. If the address includes "2CH" command, Para# is captured as GRAM data.

6.3.4.2. Write GRAM (op code = "12H" or "32H")

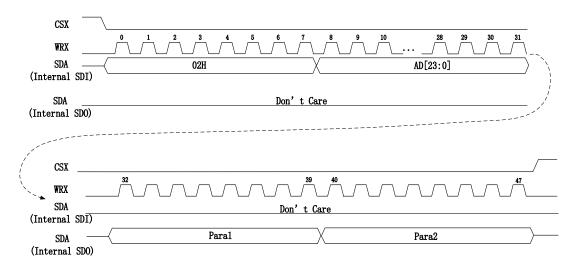

GRAM writing operation must be terminated with CSX rising edge. The GRAM DATA format is illustrated in section $6.4.10\sim6.4.13$

6.3.4.3. Read Cycle Sequence (op code = "03H")

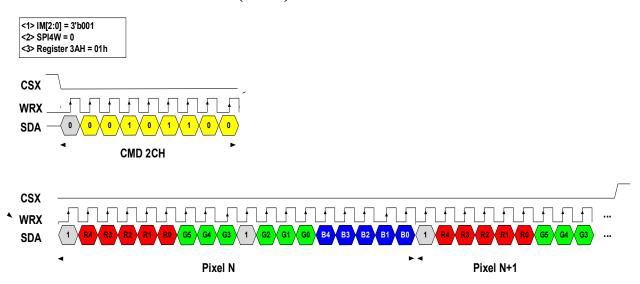

The function of command reading is also driven by CSX, WRX, SDA, as shown below. op code "03H" is sent after CSX falling edge. AD[23:0] format is {8'h00,CMD[7:0],8'h00}. SDA direction is switched to output driven by NV3041A, when WRX falling edge of last cycle of AD is arrived. As shown below.

6.5. RGB Interface

6.5.1. RGB Interface

NV3041A supplies 6-bit, 18-bit RGB interfaces for communication between MCU and NV3041A. In this case, user can send command and parameter through Std-SPI interface.

The video stream is synchronized with the VSYNC, HSYNC, and DCLK signals. The display data can be captured by NV3041A only within the active area which indicated by DE signal (de mode) or configurable area (sync mode).

The pad definition is shown below:

| Pad Name | Description |
|--------------------|---|
| DR[7:2] DG[7:2] | Data signal |
| DB[7:2] | |
| HSYNC | Horizontal synchronizing signal |
| VSYNC | Vertical-sync signal |
| DE | Valid data selection communication signal |
| DCLK | Pixel synchronizing clock |

Table 6-5-1-1

The selection of interface is done by IM<2:0> bits. Please refer to below Table 6-5-1-2

| IM2 | IM1 | IM0 | PARA_SERI | BUS Selection |
|-----|-----|-----|-----------|---|
| 1 | 0 | 0 | 0 | 6-bit input, Register E1[1:0] = 2'b00 DG[7:2], Register E1[1:0] = 2'b01 DR[7:2] Register E1[1:0] = 2'b10 DB[7:2] |
| | | | 1 | 18bit input , DR[7:2],DG[7:2],DB[7:2] |

Table 6-5-1-2

6.5.2. Parallel 18-bit RGB Timing Table

| Ite | em | Min | Тур | Max | Unit |
|-----------------|--------------|-----|-----|-----|---------------|
| DC | LK | | 9 | 12 | MHz |
| | Period Time | | 500 | | |
| | Display Area | | 480 | | |
| Horizontal Area | HBP | 8 | 10 | | DCLK |
| | HFP | | 10 | | |
| | HS Width | 2 | 4 | | |
| | Period Time | | 292 | | |
| | Display Area | | 272 | | |
| Veritcal Area | HBP | 2 | 10 | | H Period Time |
| | HFP | 2 | 10 | | |
| | VS Width | 2 | 4 | | |

Note: It is necessary to keep VBP=10 and HBP =10 in SYNC Mode. DE Mode is unnecessary to keep it.

6.5.3. Serial 6-bit RGB Timing Table

| Ite | em | Min | Тур | Max | Unit |
|-----------------|--------------|-----|------|-----|---------------|
| DC | LK | | 12 | 30 | MHz |
| | Period Time | | 1460 | | |
| | Display Area | | 1440 | | |
| Horizontal Area | НВР | 8 | 10 | | DCLK |
| | HFP | | 10 | | |
| | HS Width | 2 | 4 | | |
| | Period Time | | 292 | | |
| | Display Area | | 272 | | |
| Veritcal Area | HBP | 2 | 10 | | H Period Time |
| | HFP | 2 | 10 | | |
| | VS Width | 2 | 4 | | |

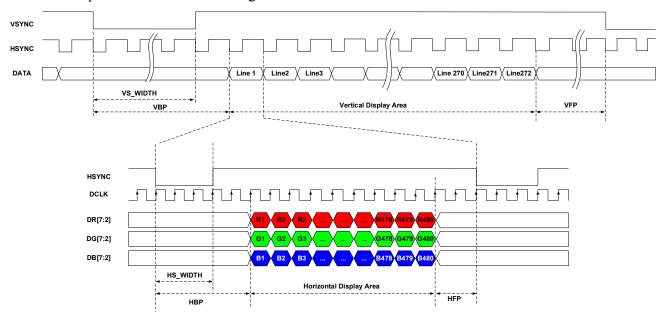

Note: It is necessary to keep VBP=10 and HBP =10 in SYNC Mode. DE Mode is unnecessary to keep it.

6.5.4. SYNC Mode Timing Diagram

When RGB interface don't send DE signal, NV3041A will recognize this condition as SYNC MODE and generate DE signal internally. Pay attention that the porch VBP and HBP must be 10.

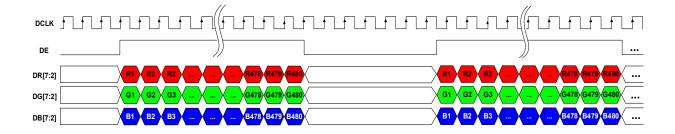

The sequence described in the figure as below

6.5.5. DE Mode Timing Diagram

When no sync signals have been sent, NV3041A will recognize this situation as DE Mode and generate sync signals internally. This mode does not need to consider any v-porch and h-porch settings.

The sequence described in the figure as below

7. Register

| 3rd Parameter | Multi-W | | | | | | | | vsa[8] | 00H |
| 4thParameter | | | | | vsa[| [7:0] | | | | 00Н |

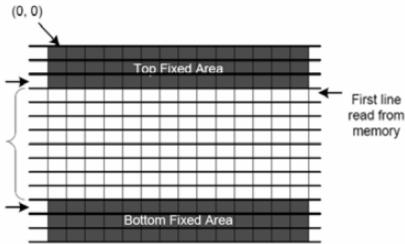

This command defines the Vertical Scrolling Area of the display.

When MADCTL ML=0

The 1st &2nd parameter TFA[7:0]describes the Top Fixed Area (in No.of lines from TOP of the Frame Memory and Display).

The 3rd &4th parameter VSA[7:0]describes the height of the Vertical Scrolling Area(in No.of lines of the Frame Memory[not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area.

TFA, VSA refer to the Frame Memory Line Point.

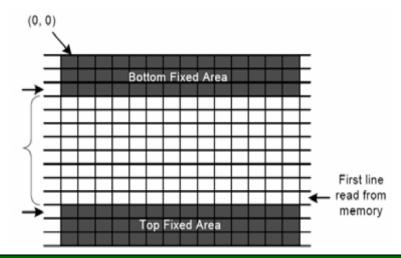

Description

When MADCTL ML=1

The 1st &2nd parameter TFA[7:0] describes the Top Fixed Area (in No.of lines from Bottom of the Frame Memory and Display).

The 3rd &4th parameter VSA[7:0] describes the height of the Vertical Sxrolling Area (in No.of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area.

NV3041A—480 RGB x 272 dot TFT LCD Single Chip Driver©2022

| Restriction | 1 . (TFA+VSA+BFA)=272 2 . In Vertical Scrol Mode, MADCTL(36H) parameter MV should be set to "0" this affects the Frame memory Write. |

8. Electrical specifications

8.1. Absolute Maximum Ratings

| Item | Symbol | Rating | Unit |
|-----------------------------|--------|---------------------|------|
| Power Supply Voltage | VDD | - 0.3 ∼ +4.6 | V |
| IO Supply Voltage | IOVCC | - 0.3 ∼ +4.6 | V |
| Charge Pump Supply Voltage | VCIP | - 0.3 ∼ +4.6 | V |
| Logic Input Voltage Range | VIN | -0.3 ~ IOVCC + 0.3 | V |
| Logic Output Voltage Range | VO | -0.3 ~ IOVCC + 0.3 | V |
| Operating Temperature Range | TOPR | - 30 ∼ +85 | °C |
| Storage Temperature Range | TSTG | -40 ~ +125 | °C |

Note: If one of the above items is exceeded its maximum limitation momentarily, the quality of the product may be degraded. Absolute maximum limitation, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the recommend range.

8.2. DC Characteristics

8.2.1. Recommended Operating Range

| Item | Symbol | Min. | Typ. | Max. | Unit | Conditions |
|-------------------------------|--------|------|------|------|------|------------|
| Supply Voltage | VCI | 3 | 3.3 | 3.6 | V | |
| IO Supply Voltage | IOVCC | 1.65 | - | VCI | V | |
| Charge Pump Supply Voltage | VCIP | 3 | 3.3 | 3.6 | V | |
| NVM Supply Voltage | VPP | 7.4 | 7.5 | 7.6 | V | |

8.2.2. DC Characteristics for Digital Circuit

| Item | Symbol | Min. | Typ. | Max. | Unit | Conditions |
|------------------------------|----------------------|---------------|----------|------------|------------|------------|
| Logic-High Input Voltage | Vih 0.7IOVCC - IOVCC | | V | IOVCC=3.3V | | |
| Logic-Low Input Voltage | | | 0.3IOVCC | V | IOVCC=3.3V | |
| Logic-High Output Voltage | Voh | IOVCC- 0.4 | _ | | V | IOVCC=3.3V |
| Logic-Low Output Voltage | Vol | DGND | - | DGND+0.4 | V | IOVCC=3.3V |

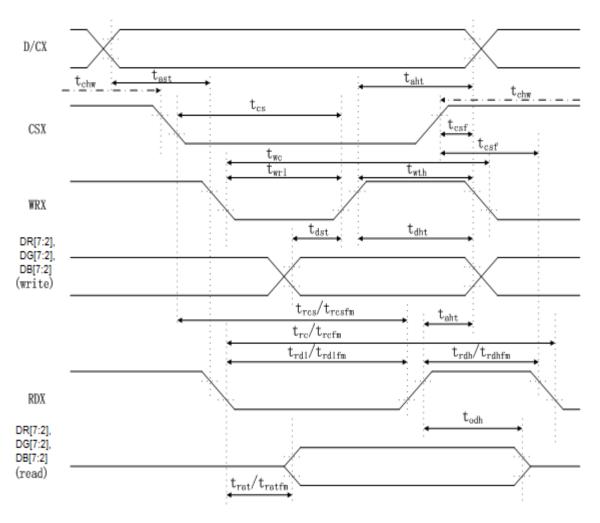

8.2.3. DC Characteristics for Analog Circuit

| Item | Symbol | Min. | Typ. | Max. | Unit | Conditions |
|-----------------------------|--------|------|------|------|------|--|
| Positive High-voltage power | VGH | 13 | 15 | | V | VCIP=3.3V |
| Negative High-voltage power | VGL | -11 | -9 | | V | VCIP=3.3V |
| Output Voltage Deviation | Vod | | ±35 | | mV | |
| Standby Current | Isc | | 70 | | uA | VCI=VCIP=3.3V |
| Operation Current | Ioc | | 30 | | mA | No Load, VCI=IOVCC= VCIP=3.3V @ FR=60Hz |

8.3. AC Characteristics

8.3.1. Parallel MCU 16/9/8-bit BUS

Note: Logic high and low levels are specified as 30% and 70% of IOVCC for Input signals.

Table 8.3.1 AC characteristics of parallel MCU in asynchronous mode

| Signal | Symbol | Parameter | MIN | MAX | UNIT | Description |
|--------|--------------------|-------------------------------------|-----|-----|------|-------------|
| D/CX | T_{AST} | Address Setup Time | 0 | | ns | |

9. Power on/off sequence

9.1. Power On Sequence

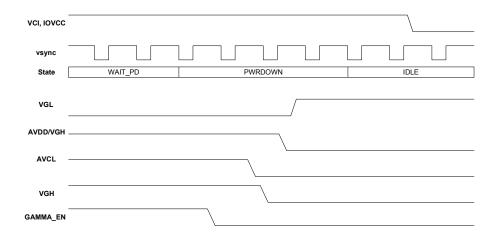

| No. | Description | Min. Time | | |
|-----|---|------------------------------|--|--|
| 1 | After VCI/IOVCC become stable, reset finished and host send command "11H" | Decide by host 11H command | | |
| 2 | VGL from 0V to -11.5V | 23ms | | |
| 3 | AVDD from VCI to 6.6V | 30.7ms | | |
| 4 | AVCL from 0 to -5V and VGH from AVDD to 15.4 | 40.8ms | | |
| 5 | Gamma output enable | 55.3ms | | |
| 6 | Source output enable | Decide by host "29H" command | | |

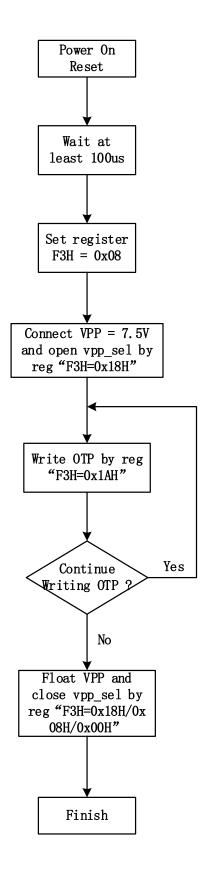

9.2. Power Off Sequence

When host sends "10H" command, State from WAIT_PD to PWRDOWN, in which power disabled sequentially.

10. OTP Flow

NV3041A—480 RGB x 272 dot TFT LCD Single Chip Driver©2022

Step 1: Attach LCD module on OTP programming machine.

| LCD module condition | | | | | |
|----------------------|-----|--|--|--|--|
| VCI(V) 3.3 | | | | | |
| VPP(V) | 7.5 | | | | |

Step 2: Initialize the non-programmed module by software.

| Function | W/R | CMD | Par | Note |
|-----------------------|-----|-----|-----|---------------------|
| HW reset | | | | HW reset sequence |
| Waiting 100ms | | | | 11 w Teset sequence |
| Display On LCD | | | | Refer Power On |
| Module | | | | Sequence |
| Display Check Pattern | | | | Recommend Flicker |
| Display Check Fattern | | | | Pattern |
| Enable Command 1 | W | F3 | 08 | |
| Adjust VCOM | W | 40 | XX | Fine tune VMF to |
| Aujust V COM | VV | 40 | ΛΛ | reduce flicker |

Step 3: Check the image quality of display module. If flicker can be still observed on the panel, repeat the command 40h until the flicker disappearance.

Step 4: Read Optimization VCOM Value

| Function | W/R | CMD | Par | Note |
|-----------------------|-----|-----|-----|-----------------|
| Read Optimization VMF | R | 40 | | VMF=Read(0x40); |
| Waiting 100ms | | | | |

Step 5: HW reset LCD Module

| Function | W/R | CMD | Par | Note |
|--------------|-----|-----|-----|--------------------|
| HW reset | | | | LIW reget goguenes |
| Waiting 20ms | | | | HW reset sequence |

Step 6: Hardware setting

| Action | Note |
|--------------------------------|------|
| RGB signal OFF | |
| External Power 7.5V to VPP Pin | |

Step 7: Enable OTP programming Mode and parameter setup

| Function | W/R | CMD | Par | Note |
|------------------|-----|-----|-----|------|
| Enable Command 2 | W | F3 | 18 | |
| Waiting 5ms | | | | |

Step 8: Program OTP.

| Function | W/R | CMD | Par | Note |
|-------------------|-----|-----|-----|-------------|
| OTP Write Command | W | F3 | 1A | Program OTP |
| Waiting 320000ms | | | | |

Step 9: Hardware setting

| Action | Note |
|--------------------------|------|
| Remove 7.5V form VPP Pin | |

Step 10: Disable OTP programming Mode.

| Function | W/R | CMD | Par | Note |
|------------------|-----|-----|-----|------|
| Disable OTP | W | F3 | 18 | |
| Programming Mode | • | 13 | 1.0 | |
| Waiting 5ms | | | | |
| Disable OTP | W | F3 | 08 | |
| Programming Mode | VV | ГЭ | 08 | |
| Waiting 20ms | | | | |
| Disable OTP | W | F3 | 00 | |
| Programming Mode | VV | 1.3 | 00 | |
| Waiting 15000ms | | | | |

Step 11: Turn off VCI and IOVCC, waiting for 200ms then and turn on again.

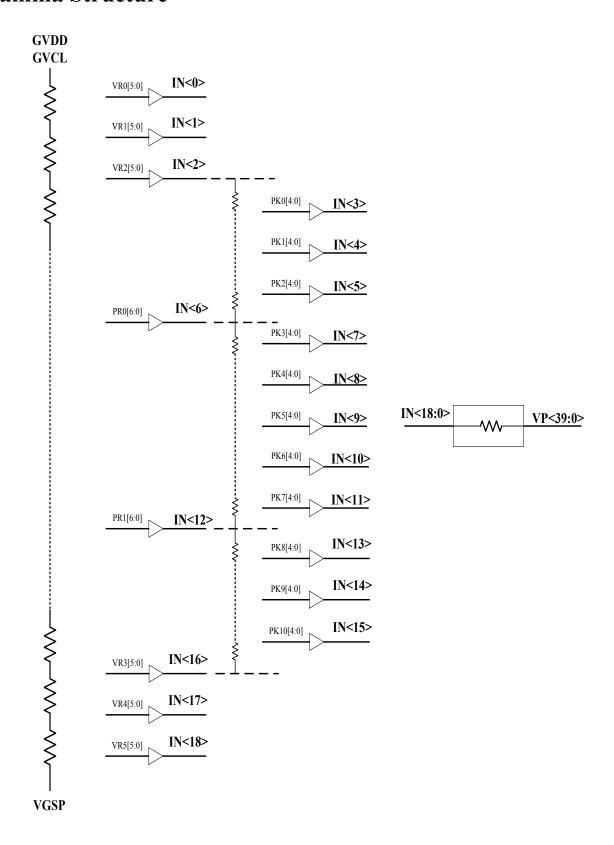

Step 12: Execute normal display on sequence.

| Function | W/R | CMD | Par | Note | |
|-----------------------|-----|-----|-----|-------------------|--|
| HW reset | | | | UW reget seguence | |
| Waiting 100ms | | | | HW reset sequence | |
| Display On LCD | | | | Refer Power On | |
| Module | | | | Sequence | |
| Dieplay Chook Pottorn | | | | Recommend Flicker | |
| Display Check Pattern | | | | Pattern | |

Step 13: Check the image quality.

11. Gamma Structure

12. Recommended panel routing resistance

The recommended wiring resistance values are given below. The wiring resistance values affect the current capability of the power supply blocks and thus must be designed within the given range.

| Item | Pin Name | Unit: ohm | |
|------|-----------|-----------|--|
| 1 | VPP | <3 | |
| 2 | GVDD | <50 | |
| 3 | GVCL | <50 | |
| 4 | VGSP | <50 | |
| 5 | VCOM | <3 | |
| 6 | DGND | <3 | |
| 7 | DVDD | <50 | |
| 8 | IOVCC | <3 | |
| 9 | VCI | <3 | |
| 10 | VSYNC | <50 | |
| 11 | HSYNC | <50 | |
| 12 | DCLK | <50 | |
| 13 | VDPOL | <50 | |
| 14 | HDPOL | <50 | |
| 15 | DCLKPOL | <50 | |
| 16 | SBGR | <50 | |
| 17 | DE | <50 | |
| 18 | PARA_SERI | <50 | |
| 19 | RDX | <50 | |
| 20 | HDIR | <50 | |
| 21 | VDIR | <50 | |
| 22 | CS | <50 | |

| Item | Pin Name | Unit: ohm |
|------|----------|-----------|
| 23 | SDA | <50 |
| 24 | WRX | <50 |
| 25 | DISP | <50 |
| 26 | GRB | <50 |
| 27 | SYNC | <50 |
